## Done

- Revised and took a final exam at Thursday (Advanced Computer Architecture).
- Tested algorithms on extracted data. Clustering-related and tensor-related. The result was below expectation.

One reason: We found missing data which was caused by imperfect code. However, Spark on cluster failed.

The number of cheated players extracted is too small, and the timespan is short. Hence, it may cause the tensor algorithm to failure.

Newly extracted data from Yvquan is available. I have to think about ways to avoid the spark.

One way is sampling. Will be tested next week.

- Revised TVCG paper.

## To do

- Finish revision of TVCG before taking winter vacation.
- Try other methods on data.
- If possible, construct one or several concrete ideas before taking winter vacation.
